## Todo List

### Global **BTN\_CHIP\_NUM**

read buttons

### Global **led\_cycle\_test** (void)

This won't work now: write\_display\_driver(counter);

### Global **mat\_mul** (Complex M[2][2], Complex V[], int i, int j)

Because of the way the array types work (you can't pass a multidimensional array of unknown size) we will also need a function for 4x4 matrix multiplication.

### Global **read\_external\_buttons** (void)

How long should this be?

button remappings...

### Global **setup\_timer** ()

distinguish between the two different timers here...

### Global **TLC591x\_mode\_switch** (int mode)

mode switcher for **LED** Driver

### Global **write\_display\_driver** (void)

How long should this be?

## Chapter 2

# Data Structure Index

### 2.1 Data Structures

Here are the data structures with brief descriptions:

<a href="#">LED</a>	Each <a href="#">LED</a> has the following type . . . . .	<a href="#">7</a>
<a href="#">LED_GLOBAL</a>	Pin mappings Pins for LE and OE on port D OE = RD4 = uC:81 = J1:28 = J10:14 LE = RD3 = uC:78 = J1:40 = J11:18 . . . . .	<a href="#">7</a>

## Chapter 3

# File Index

### 3.1 File List

Here is a list of all documented files with brief descriptions:

dspic33e/qcomp-sim-c.X/ <a href="#">algo.c</a>	
Contains quantum algorithms to be run . . . . .	9
dspic33e/qcomp-sim-c.X/ <a href="#">algo.h</a>	
Header file for algorithms . . . . .	9
dspic33e/qcomp-sim-c.X/ <a href="#">config.h</a>	
General config settings #pragma for microcontroller . . . . .	9
dspic33e/qcomp-sim-c.X/ <a href="#">io.c</a>	
Contains all the functions for reading buttons and writing to LEDs . . . . .	10
dspic33e/qcomp-sim-c.X/ <a href="#">io.h</a>	
Description: Header file for input output functions . . . . .	17

The main function . . . . .	22
dspic33e/qcomp-sim-c.X/ <a href="#">quantum.c</a>	
Description: Contains matrix and vector arithmetic for simulating one qubit . . . . .	23
dspic33e/qcomp-sim-c.X/ <a href="#">quantum.h</a>	
Description: Header file containing all the matrix arithmetic for simulating a single qubit . . . . .	26
dspic33e/qcomp-sim-c.X/ <a href="#">spi.c</a>	
Description: Functions for communicating with serial devices . . . . .	30
dspic33e/qcomp-sim-c.X/ <a href="#">spi.h</a>	
Description: SPI communication functions . . . . .	31
dspic33e/qcomp-sim-c.X/ <a href="#">tests.c</a>	
Description: Contains all the tests we have performed on the micro- controller . . . . .	32
dspic33e/qcomp-sim-c.X/ <a href="#">tests.h</a>	
Description: Header file containing all the tests we performed . . . . .	33
dspic33e/qcomp-sim-c.X/ <a href="#">time.c</a>	
Description: Functions to control the on chip timers . . . . .	34
dspic33e/qcomp-sim-c.X/ <a href="#">time.h</a>	
Description: Header file containing all the timing functions . . . . .	34

## Chapter 4

# Data Structure Documentation

### 4.1 LED Struct Reference

Each LED has the following type.

```
#include <io.h>
```

#### Data Fields

- int **R** [2]  
• int **G** [2]  
*Red mapping array: [chip number, line number].*
- int **B** [2]  
*Green mapping array.*
- unsigned \_Fract **N\_R**  
*Blue mapping array.*
- unsigned \_Fract **N\_G**  
*The R brightness.*
- unsigned \_Fract **N\_B**  
*The G brightness.*

#### 4.1.1 Detailed Description

Each LED has the following type.

The type holds the information about the position of the RGB lines in the display driver array and also the brightness of the RGB lines. The counters are used by a timer interrupt service routine pulse the RGB LEDs at a specified rate.

The position of the LED lines are contained in an array

The type of the counter is *Fract* to facilitate easy comparison with the  $N^*$  variables which used the fractional type.

The documentation for this struct was generated from the following file:

- dspic33e/qcomp-sim-c.X/[io.h](#)

### 4.2 LED\_GLOBAL Struct Reference

pin mappings Pins for LE and OE on port D OE = RD4 = uC:81 = J1:28 = J10:14 LE = RD3 = uC:78 = J1:40 = J11:18

```
#include <io.h>
```

## Data Fields

- int [strobe\\_leds](#)  
*Bit set the LEDs which are strobing.*
- int [strobe\\_state](#)  
*Bit zero is the current state (on/off)*

### 4.2.1 Detailed Description

pin mappings Pins for LE and OE on port D OE = RD4 = uC:81 = J1:28 = J10:14 LE = RD3 = uC:78 = J1:40 = J11:18

Pins for SH and CLK\_INH on port D SH = RD5 = uC:82 = J1:25 = J10:13 CLK\_INH = RD8 = uC:68 = J1:58 = J11:25Global [LED](#) strobing state parameter

The documentation for this struct was generated from the following file:

- [dspic33e/qcomp-sim-c.X/io.h](#)

## Chapter 5

# File Documentation

### 5.1 dspic33e/qcomp-sim-c.X/algo.c File Reference

Contains quantum algorithms to be run.

```
#include "io.h"
#include "quantum.h"
#include "algo.h"
#include <math.h>
Include dependency graph for algo.c:
```

#### 5.1.1 Detailed Description

Contains quantum algorithms to be run.

### 5.2 dspic33e/qcomp-sim-c.X/algo.h File Reference

header file for algorithms

This graph shows which files directly or indirectly include this file:

#### Macros

- #define **NUM\_QUBITS** 3
- #define **STATE\_LENGTH** 8

#### 5.2.1 Detailed Description

header file for algorithms

### 5.3 dspic33e/qcomp-sim-c.X/config.h File Reference

General config settings #pragma for microcontroller.

This graph shows which files directly or indirectly include this file:

### 5.3.1 Detailed Description

General config settings #pragma for microcontroller.

Description: Include this once at the top of main

## 5.4 dspic33e/qcomp-sim-c.X/io.c File Reference

Contains all the functions for reading buttons and writing to LEDs.

```
#include "io.h"
#include "time.h"
#include "spi.h"
```

Include dependency graph for io.c:

### Macros

- #define **DISPLAY\_CHIP\_NUM** 2
- #define **PERIOD** 500000
- #define **BTN\_CHIP\_NUM** 2

*Read external buttons.*

### Functions

- int **led\_color\_int** (int device, int R, int G, int B)  
*Takes led number & RGB -> returns integer for sending via SPI to set the LED.*
- int **setup\_io** (void)  
*Set up LEDs and buttons on port D.*
- void **\_\_attribute\_\_** ((\_\_interrupt\_\_, no\_auto\_psv))  
*The max value for isr\_counter.*
- void **setup\_external\_leds** (void)  
*Set external variable RGB LEDs.*
- void **stop\_external\_leds** (void)  
*Stop LEDs flashing.*
- void **set\_strobe** (int color, int state)  
*Set an LED strobing.*
- void **toggle\_strobe** (int color)  
*Toggle LED strobe.*
- int **set\_led** (int color, int state)  
*Turn a particular LED on or off.*
- int **read\_btn** (int btn)  
*Read the state of a push button.*
- void **leds\_off** (void)  
*Turn all the LEDs off.*
- void **flash\_led** (int color, int number)  
*Flash LED a number of times.*
- void **flash\_all** (int number)  
*Flash all the LEDs a number of times.*
- int **update\_display\_buffer** (int n, bool R, bool G, bool B)
- int **write\_display\_driver** (void)  
*Turn on an LED via the external display driver.*

- int `TLC591x_mode_switch` (int mode)  
*Switch between normal and special mode.*
- int `set_external_led` (int index, unsigned \_Fract R, unsigned \_Fract G, unsigned \_Fract B)  
*Updates color properties of global led array.*
- int `read_external_buttons` (void)  
*Update the buttons array (see declaration above)*
- int `led_cycle_test` (void)  
*Loop to cycle through LEDs 0 - 15.*
- void `varying_leds` (void)  
*Routine to test the set\_external\_led function.*

## Variables

- int `buttons` [16]  
*Contains the button states.*
- `LED_GLOBAL led_global` = {0}
- `LED led` [LED\_NUM]  
*The LED array – global in this file.*
- int `display_buf` [DISPLAY\_CHIP\_NUM] = {0}  
*Display buffer to be written to display driver.*
- unsigned \_Fract `isr_counter` = 0  
*Counter for the interrupt service routine \_T5Interrupt.*
- unsigned \_Fract `isr_res` = 0.01  
*Counter value.*
- const unsigned \_Fract `isr_limit` = 0.95  
*Counter resolution.*

### 5.4.1 Detailed Description

Contains all the functions for reading buttons and writing to LEDs.

#### Author

J Scott

#### Date

8/11/18

### 5.4.2 Macro Definition Documentation

#### 5.4.2.1 #define BTN\_CHIP\_NUM 2

Read external buttons.

The external buttons are interfaced to the microcontroller via a shift register. Data is shifted in a byte at a time using the SPI 3 module. The sequence to read the buttons is as follows:

1) Momentarily bring SH low to latch button data into the shift registers 2) Bring CLK\_INH low to enable the clock input on the shift register 3) Start the SPI 3 clock and read data in via the SDI 3 line

The control lines SH and CLK\_INH are on port D

**Todo** read buttons

### 5.4.3 Function Documentation

#### 5.4.3.1 void \_\_attribute\_\_ ( (\_\_interrupt\_\_, no\_auto\_psv) )

The max value for isr\_counter.

Interrupt service routine for timer 4

Interrupt service routines are automatically called by the microcontroller when an event occurs. In this case, \_T5← Interrupt is called when the 32 bit timer formed from T4 and T5 reaches its preset period. The silly name and sill attributes are so that the compiler can correctly map the function in the microcontroller memory. More details of interrupts and interrupt vectors can be found in the compiler manual and the dsPIC33E datasheet.

The job of this routine is to control the modulated brightnesses of the RBG LEDs. This routine is set to be called periodically with a very long period on the time scale of microcontroller operations, but very fast in comparison to what the eye can see. For example, once every 100us. Loop over all the LEDs (the index i).

Decide whether R, G or B should be turned off

Write the display buffer data to the display drivers It's important this line goes here rather than after the the final update\_display\_buffer below. Otherwise you get a flicker due to the LEDs all coming on at the start of this loop

Reset the counter

Turn on all the LEDs back on

#### 5.4.3.2 void flash\_all ( int number )

Flash all the LEDs a number of times.

Parameters

<i>number</i>	
---------------	--

#### 5.4.3.3 void flash\_led ( int color, int number )

Flash [LED](#) a number of times.

Flash one [LED](#) a number of times.

#### 5.4.3.4 int led\_color\_int ( int device, int R, int G, int B )

Takes led number & RGB -> returns integer for sending via SPI to set the [LED](#).

Parameters

<i>device</i>	input <a href="#">LED</a> number to change
<i>R</i>	red value between 0 & 1
<i>G</i>	green value between 0 & 1
<i>B</i>	blue value between 0 & 1

Returns

Returns int to be sent to [LED](#) Driver

convention RGB -> 000

Each [LED](#) takes 3 lines, assumes there are no gaps between [LED](#) channels "device" goes between 0 to  $2^n - 1$

#### 5.4.3.5 int led\_cycle\_test ( void )

Loop to cycle through LEDs 0 - 15.

**Todo** This won't work now: `write_display_driver(counter);`

#### 5.4.3.6 `int read_btn ( int btn )`

Read the state of a push button.

Parameters

<i>btn</i>	
------------	--

Note

How well do you know C

#### 5.4.3.7 `int read_external_buttons ( void )`

Update the buttons array (see declaration above)

SH pin

**Todo** How long should this be?

**Todo** button remappings...

#### 5.4.3.8 `int set_external_led ( int index, unsigned _Fract R, unsigned _Fract G, unsigned _Fract B )`

Updates color properties of global led array.

Parameters

<i>led_index</i>	
<i>R</i>	red value between 0 & 1
<i>G</i>	green value between 0 & 1
<i>B</i>	blue value between 0 & 1

Returns

0 if successful, -1 otherwise

Use the function to set the RGB level of an [LED](#). The [LED](#) is chosen using the

Parameters

<i>led_index.</i>	The
<i>R</i>	param G and
<i>B</i>	are numbers between 0 and 1 (not including 1) indicating the amount of each color. The function returns 0 if successful and -1 otherwise.

#### 5.4.3.9 `int set_led ( int color, int state )`

Turn a particular [LED](#) on or off.

## Parameters

<i>color</i>	
<i>state</i>	

5.4.3.10 void set\_strobe ( int *color*, int *state* )

Set an LED strobing.

## Parameters

<i>color</i>	
<i>state</i>	

## 5.4.3.11 void setup\_external\_leds ( void )

Set external variable RGB LEDs.

Initialise LED lines

Initialise parameters to zero

Initialise display buffer to zero

## 5.4.3.12 int setup\_io ( void )

Set up LEDs and buttons on port D.

< Set port c digital for spi3

Set the OE pin high

Set OE(ED2) pin

Set the SH pin high

Set SH pin

set CLK\_INH high while buttons are pressed

5.4.3.13 int TLC591x\_mode\_switch ( int *mode* )

Switch between normal and special mode.

The mode switch for the TLC591x chip is a bit tricky because it involves synchronising the control lines LE(ED1) and OE(ED2) on Port D with the SPI 1 clock. To initiate a mode switch, OE(ED2) must be brought low for one clock cycle, and then the value of LE(ED1) two clock cycles later determines the new mode. See the diagrams on page 19 of the datasheet

So long as the timing is not strict, we can probably implement the mode switch by starting a non-blocking transfer of 1 byte to the device (which starts the SPI 1 clock), followed by clearing OE(ED2) momentarily and then setting the value of LE(ED1) as required. So long as those two things happen before the SPI 1 clock finishes the procedure will probably work. (The reason is the lack of max timing parameters on page 9 for the setup and hold time for ED1 and ED2, which can therefore presumably be longer than one clock cycle.)

## Parameters

<i>mode</i>	
-------------	--

**Todo** mode switcher for LED Driver

5.4.3.14 void toggle\_strobe ( int *color* )

Toggle LED strobe.

## Parameters

<i>color</i>	
--------------	--

5.4.3.15 `int update_display_buffer ( int n, bool R, bool G, bool B )`

## Parameters

<i>index</i>	LED number to modify
<i>R</i>	Intended value of the R led
<i>G</i>	Intended value of the G led
<i>B</i>	Intended value of the B led

## Returns

0 if successful

Could this get any worse!

This function is supposed to make the display writing process more efficient. It updates a global display buffer which is written periodically to the led display drivers. Instead of the display driver function re-reading the desired state of all the LED lines every time it is called, this function can be used to update only the lines that have changed.

There are quite a few potential bugs in here, mainly array out of bounds if the DISPLAY\_CHIP\_NUM is not set correctly or the LED RGB lines are wrong. (Or if there are just bugs.) Set or clear the red LED of the nth LED

Set or clear the red LED of the nth LED

Set or clear the red LED of the nth LED

5.4.3.16 `int write_display_driver ( void )`

Turn on an LED via the external display driver.

Send a byte to the display driver.

On power on, the chip (TLC591x) is in normal mode which means that the clocked bytes sent to the chip set which LEDs are on and which are off (as opposed to setting the current of the LEDs)

To write to the device, use the SPI module to write a byte to the SDI 1 pin on the chip. Then momentarily set the LE(ED1) pin to latch the data onto the output register. Finally, bring the OE(ED2) pin low to enable the current sinking to turn on the LEDs. See the timing diagram on page 17 of the datasheet for details.

LE(ED1) and OE(ED2) will be on Port D Set LE(ED1) pin

**Todo** How long should this be?

## 5.4.4 Variable Documentation

5.4.4.1 `int buttons[16]`

Contains the button states.

Each entry in the array is either 1 if the button is pressed or 0 if not. The array is accessed globally using 'extern buttons;' in a \*.c file. Read buttons array us updated by calling read\_external\_buttons

5.4.4.2 `unsigned _Fract isr_counter = 0`

Counter for the interrupt service routine \_T5Interrupt.

These variables are for keeping track of the interrupt based [LED](#) pulsing. The type is `_Fract` because it is easier to directly compare two `_Fracts` than attempt multiplication of integers and `_Fracts` (which isn't supported) The limit is not 1 because `_Fract` types do not go up to 1.

It's probably a good idea to make sure the `isr_res` counter doesn't overflow (by ensuring that `isr_res + isr_limit` does not exceed 0.999..., the max value of unsigned `_Fract`).

#### 5.4.4.3 LED\_GLOBAL `led_global = {0}`

##### Parameters

<code>led_global</code>	Global <a href="#">LED</a> strobing state parameter
-------------------------	---

## 5.5 dspic33e/qcomp-sim-c.X/io.h File Reference

Description: Header file for input output functions.

```
#include "p33EP512MU810.h"
#include "xc.h"
#include <stdbool.h>
```

Include dependency graph for `io.h`: This graph shows which files directly or indirectly include this file:

### Data Structures

### 5.5.1 Detailed Description

Description: Header file for input output functions.

Include it at the top of any C source file which uses buttons and LEDs. It also defines various constants representing the positions of the buttons and LEDs on port D.

### 5.5.2 Function Documentation

#### 5.5.2.1 void [flash\\_all](#) ( int *number* )

Flash all the LEDs a number of times.

Parameters

<i>number</i>	
---------------	--

#### 5.5.2.2 void [flash\\_led](#) ( int *color*, int *number* )

Flash one LED a number of times.

## Parameters

<i>color</i>	
<i>number</i>	

Flash one [LED](#) a number of times.

5.5.2.3 `int led_color_int ( int device, int R, int G, int B )`

Takes led number & RGB -> returns integer for sending via SPI to set the [LED](#).

## Parameters

<i>device</i>	input <a href="#">LED</a> number to change
<i>R</i>	red value between 0 & 1
<i>G</i>	green value between 0 & 1
<i>B</i>	blue value between 0 & 1

## Returns

Returns int to be sent to [LED](#) Driver

convention RGB -> 000

Each [LED](#) takes 3 lines, assumes there are no gaps between [LED](#) channels "device" goes between 0 to  $2^n - 1$

5.5.2.4 `int led_cycle_test ( void )`

Loop to cycle through LEDs 0 - 15.

**Todo** This won't work now: `write_display_driver(counter);`

5.5.2.5 `int read_btn ( int btn )`

Read the state of a push button.

## Parameters

<i>btn</i>	
------------	--

## Note

How well do you know C

5.5.2.6 `int read_external_buttons ( void )`

Update the buttons array (see declaration above)

SH pin

**Todo** How long should this be?

**Todo** button remappings...

5.5.2.7 `int set_external_led ( int index, unsigned _Fract R, unsigned _Fract G, unsigned _Fract B )`

Updates color properties of global led array.

**Parameters**

<i>led_index</i>	
<i>R</i>	red value between 0 & 1
<i>G</i>	green value between 0 & 1
<i>B</i>	blue value between 0 & 1

**Returns**

0 if successful, -1 otherwise

Use the function to set the RGB level of an LED. The LED is chosen using the

**Parameters**

<i>led_index.</i>	The
<i>R</i>	param G and
<i>B</i>	are numbers between 0 and 1 (not including 1) indicating the amount of each color. The function returns 0 if successful and -1 otherwise.

**5.5.2.8 int set\_led ( int color, int state )**

Turn a particular LED on or off.

**Parameters**

<i>color</i>	
<i>state</i>	

**5.5.2.9 void set\_strobe ( int color, int state )**

Set an LED strobing.

**Parameters**

<i>color</i>	
<i>state</i>	

**5.5.2.10 void setup\_external\_leds ( void )**

Set external variable RGB LEDs.

Initialise LED lines

Initialise parameters to zero

Initialise display buffer to zero

**5.5.2.11 int setup\_io ( void )**

Set up LEDs and buttons on port D.

< Set port c digital for spi3

Set the OE pin high

Set OE(ED2) pin

Set the SH pin high

Set SH pin

set CLK\_INH high while buttons are pressed

#### 5.5.2.12 void toggle\_strobe ( int *color* )

Toggle LED strobe.

Parameters

<i>color</i>	
--------------	--

#### 5.5.2.13 int update\_display\_buffer ( int *n*, bool *R*, bool *G*, bool *B* )

Parameters

<i>led_index</i>	LED number to modify
<i>R</i>	Intended value of the R led
<i>G</i>	Intended value of the G led
<i>B</i>	Intended value of the B led

Returns

0 if successful

Parameters

<i>index</i>	LED number to modify
<i>R</i>	Intended value of the R led
<i>G</i>	Intended value of the G led
<i>B</i>	Intended value of the B led

Returns

0 if successful

Could this get any worse!

This function is supposed to make the display writing process more efficient. It updates a global display buffer which is written periodically to the led display drivers. Instead of the display driver function re-reading the desired state of all the LED lines every time it is called, this function can be used to update only the lines that have changed.

There are quite a few potential bugs in here, mainly array out of bounds if the DISPLAY\_CHIP\_NUM is not set correctly or the LED RGB lines are wrong. (Or if there are just bugs.) Set or clear the red LED of the nth LED

Set or clear the red LED of the nth LED

Set or clear the red LED of the nth LED

#### 5.5.2.14 int write\_display\_driver ( void )

Send a byte to the display driver.

Don't use this function to write to LEDs – use the set\_external\_led function

Send a byte to the display driver.

On power on, the chip (TLC591x) is in normal mode which means that the clocked bytes sent to the chip set which LEDs are on and which are off (as opposed to setting the current of the LEDs)

To write to the device, use the SPI module to write a byte to the SDI 1 pin on the chip. Then momentarily set the [LE\(ED1\)](#) pin to latch the data onto the output register. Finally, bring the OE(ED2) pin low to enable the current sinking to turn on the LEDs. See the timing diagram on page 17 of the datasheet for details.

[LE\(ED1\)](#) and OE(ED2) will be on Port D Set [LE\(ED1\)](#) pin

**Todo** How long should this be?

## 5.6 dspic33e/qcomp-sim-c.X/main.c File Reference

### Functions

- int [main](#) (void)

### 5.6.1 Detailed Description

The main function.

#### Author

J R Scott

#### Date

8/11/18

Contains an example of fixed precision 2x2 matrix multiplication for applying operations to a single qubit. The only operations included are H, X and Z so that everything is real (this can be extended later).

All the functions have now been moved into separate files. [io.h](#) and [io.c](#) contain functions for reading and controlling the buttons and LEDs, and [quantum.h/quantum.c](#) contain the matrix arithmetic for simulating one qubit.

Compile command: make (on linux). But if you want to program the micro- controller too or if you're using windows you're better of downloading and installing MPLAB-X <https://www.microchip.com/mplab/mplab-x-ide>.

#### Note

You also need the microchip xc16 compilers which are available from <https://www.microchip.com/mplab/compilers>

## 5.6.2 Function Documentation

### 5.6.2.1 int main ( void )

Reading button state

The button states are written into an array of type BUTTON\_ARRAY whose

Global variable for button state

Update the buttons variable

Do something if button 0 has been pressed...

<

Note

Really important!

## 5.7 dspic33e/qcomp-sim-c.X/quantum.c File Reference

Description: Contains matrix and vector arithmetic for simulating one qubit.

```

### 5.7.1 Detailed Description

Description: Contains matrix and vector arithmetic for simulating one qubit.

### 5.7.2 Function Documentation

#### 5.7.2.1 void make\_ops ( Complex X[2][2], Complex Y[2][2], Complex Z[2][2], Complex H[2][2] )

Create complex X, Y, Z and H.

## Parameters

$X$	Pauli X c-Matrix
$Z$	Pauli Z c-matrix
$H$	Hadamard c-matrix
$Y$	Pauli Y c-matrix

5.7.2.2 void mat\_mul ( Complex  $M[2][2]$ , Complex  $V[]$ , int  $i$ , int  $j$  )

2x2 complex matrix multiplication

## Parameters

$M$	complex matrix
$V$	complex vector
$i$	integer first element of state vector
$j$	integer second element of state vector

**Todo** Because of the way the array types work (you can't pass a multidimensional array of unknown size) we will also need a function for 4x4 matrix multiplication.

5.7.2.3 void qubit\_display ( Complex  $state[]$ , int  $N$  )

Display the state amplitudes on LEDs.

## Parameters

$state$	Pass in the state vector
$N$	The total number of qubits

## Note

Currently the function only displays superpositions using the red and blue colors.

The routine works by adding up the squares of the amplitudes corresponding to each state of a given qubit. Suppose there are three qubits. Then the state vector is given by

index	binary	amplitude
0	0 0 0	$a_0$
1	0 0 1	$a_1$
2	0 1 0	$a_2$
3	0 1 1	$a_3$
4	1 0 0	$a_4$
5	1 0 1	$a_5$
6	1 1 0	$a_6$
7	1 1 1	$a_7$
-----		
Qubit:	2 1 0	

Consider qubit 2. The value of the ZERO state is formed by adding up all the amplitudes corresponding to its ZERO state. That is, indices 0, 1, 2 and 3. The ONE state is obtained by adding up the other indices: 4, 5, 6 and 7.

So the amplitudes for qubit 2 are

ZERO:  $(a_0)^2 + (a_1)^2 + (a_2)^2 + (a_3)^2$  ONE:  $(a_4)^2 + (a_5)^2 + (a_6)^2 + (a_7)^2$

Corresponding to the following indices:

ZERO: 0+0, 1+0, 2+0, 3+0 ONE: 4+0, 5+0, 6+0, 7+0

For qubit 1 the indices are:

ZERO: 0+0, 0+4, 1+0, 1+4 ONE: 2+0, 2+4, 3+0, 3+4

And for qubit 0 the indices are:

ZERO: 0+0, 0+2, 0+4, 0+6 ONE: 1+0, 1+2, 1+4, 1+6

The examples above are supposed to show the general pattern. For N qubits, qubit number k, the ZERO and ONE states are given by summing all the square amplitudes corresponding to the following indices:

ZERO:  $n + (2^{k+1} * j)$ , where  $n = 0, 1, \dots, 2^k - 1$  and  $j = 0, 1, \dots, 2^{N-k-2}$

ONE:  $n + (2^{k+1} * j)$ , where  $n = 2^k, 2^k + 1, \dots, 2^{k+1} - 1$  and  $j = 0, 1, \dots, 2^{N-k-2}$

The amplitudes are obtained by summing over both n and j. Notice that there is an edge condition when  $k = N-1$ . There, j apparently ranges from 0 to -1. In this case, the only value of j is 0. The condition arises because of the way that  $2^{N-k-2}$  is obtained (i.e. such that multiplying it by  $2^{k+1}$  gives  $2^{N-1}$ .) However, if  $k = N-1$ , then  $2^{k+1} = 2^N$  already, so it must be multiplied by  $2^{-1}$ . The key point is that the second term should not ever equal  $2^N$ , so j should stop at 0.

The above indices can be expressed as the sum of a ROOT and a STEP as follows:

index = ROOT + STEP

where ROOT ranges from 0 to  $2^k - 1$ . This corresponds to the n values that give rise to ZERO. The indices for ONE can be obtained by adding  $2^k$  to root. The STEP = j is a multiple of  $2^{k+1}$  starting from zero that does not equal or exceed  $2^N$ . ROOT can be realised using the following for loop:

```
for(int root = 0; root < 2^k; root++) { ... // ZERO index root; // ONE index root + 2^k; }
```

Then the STEP component can be realised as

```
for(int step = 0; step < 2^N; step += 2^(k+1)) { // Add the following to root... step; } Loop over all qubits k = 0, 1, 2, ... N-1
```

ROOT loop

STEP loop

Zeros are at the index root + step

Ones are at the index root +  $2^k$  + step

update leds for each qubits average zero and one amps

#### 5.7.2.4 void single\_qubit\_op ( Complex op[2][2], int qubit, Complex state[], int Qnum )

apply operator

Parameters

<i>state</i>	state vector containing amplitudes
<i>qubit</i>	qubit number to apply 2x2 matrix to
<i>Qnum</i>	total number of qubits in the state
<i>op</i>	2x2 operator to be applied

This routine applies a single qubit gate to the state vector

## Parameters

<i>state.</i>	index	binary	amplitude
	0	0 0 0	a_0
	1	0 0 1	a_1
	2	0 1 0	a_2
	3	0 1 1	a_3
	4	1 0 0	a_4
	5	1 0 1	a_5
	6	1 1 0	a_6
	7	1 1 1	a_7
	-----		
	Qubit:	2 1 0	

Consider qubit 2. The value of the ZERO state is formed by adding up all the amplitudes corresponding to its ZERO state. That is, indices 0, 1, 2 and 3. The ONE state is obtained by adding up the other indices: 4, 5, 6 and

1.

$2^{(\text{total qbits} - 1 - \text{current})}$

Loop here for each contribution to the zero and one amplitude

loop over j

$n + j * 2^{(k+1)}$

#### 5.7.2.5 void zero\_state ( Complex state[], int Qnum )

Initialise state to the vacuum (zero apart from the first position) Specify the dimension – of the matrix, i.e.

$2^{(\text{number of qubits})}$

#### Note

oh the clarity!

### 5.8.1 Detailed Description

Description: Header file containing all the matrix arithmetic for simulating a single qubit.

### 5.8.2 Function Documentation

#### 5.8.2.1 void [make\\_ops](#) ( [Complex](#) X[2][2], [Complex](#) Y[2][2], [Complex](#) Z[2][2], [Complex](#) H[2][2] )

Create complex X, Y, Z and H.

##### Parameters

<i>X</i>	Pauli X c-Matrix
<i>Z</i>	Pauli Z c-matrix
<i>H</i>	Hadamard c-matrix
<i>Y</i>	Pauli Y c-matrix

#### 5.8.2.2 void [mat\\_mul](#) ( [Complex](#) M[2][2], [Complex](#) V[], int *i*, int *j* )

2x2 complex matrix multiplication

##### Parameters

<i>M</i>	complex matrix
<i>V</i>	complex vector
<i>i</i>	integer first element of state vector
<i>j</i>	integer second element of state vector

**Todo** Because of the way the array types work (you can't pass a multidimensional array of unknown size) we will also need a function for 4x4 matrix multiplication.

#### 5.8.2.3 void [qubit\\_display](#) ( [Complex](#) state[], int *N* )

Display the state amplitudes on LEDs.

## Parameters

<i>state</i>	Pass in the state vector
<i>Qnum</i>	The total number of qubits

## Note

Currently the function only displays superpositions using the red and blue colors.

## Parameters

<i>state</i>	Pass in the state vector
<i>N</i>	The total number of qubits

## Note

Currently the function only displays superpositions using the red and blue colors.

The routine works by adding up the squares of the amplitudes corresponding to each state of a given qubit. Suppose there are three qubits. Then the state vector is given by

index	binary	amplitude
0	0 0 0	a_0
1	0 0 1	a_1
2	0 1 0	a_2
3	0 1 1	a_3
4	1 0 0	a_4
5	1 0 1	a_5
6	1 1 0	a_6
7	1 1 1	a_7

-----

Qubit:     2 1 0

Consider qubit 2. The value of the ZERO state is formed by adding up all the amplitudes corresponding to its ZERO state. That is, indices 0, 1, 2 and 3. The ONE state is obtained by adding up the other indices: 4, 5, 6 and 7.

So the amplitudes for qubit 2 are

ZERO:  $(a_0)^2 + (a_1)^2 + (a_2)^2 + (a_3)^2$  ONE:  $(a_4)^2 + (a_5)^2 + (a_6)^2 + (a_7)^2$

Corresponding to the following indices:

ZERO: 0+0, 1+0, 2+0, 3+0 ONE: 4+0, 5+0, 6+0, 7+0

For qubit 1 the indices are:

ZERO: 0+0, 0+4, 1+0, 1+4 ONE: 2+0, 2+4, 3+0, 3+4

And for qubit 0 the indices are:

ZERO: 0+0, 0+2, 0+4, 0+6 ONE: 1+0, 1+2, 1+4, 1+6

The examples above are supposed to show the general pattern. For N qubits, qubit number k, the ZERO and ONE states are given by summing all the square amplitudes corresponding to the following indices:

ZERO:  $n + (2^{k+1} * j)$ , where  $n = 0, 1, \dots, 2^k - 1$  and  $j = 0, 1, \dots, 2^{N-k-2}$

ONE:  $n + (2^{k+1} * j)$ , where  $n = 2^k, 2^k + 1, \dots, 2^{k+1} - 1$  and  $j = 0, 1, \dots, 2^{N-k-2}$

The amplitudes are obtained by summing over both n and j. Notice that there is an edge condition when  $k = N-1$ . There, j apparently ranges from 0 to -1. In this case, the only value of j is 0. The condition arises because of the way that  $2^{N-k-2}$  is obtained (i.e. such that multiplying it by  $2^{k+1}$  gives  $2^{N-1}$ .) However, if  $k = N-1$ , then  $2^{k+1} = 2^N$  already, so it must be multiplied by  $2^{-1}$ . The key point is that the second term should not ever equal  $2^N$ , so j should stop at 0.

The above indices can be expressed as the sum of a ROOT and a STEP as follows:

— Pin mappings for SPI 3 module — SPI 3 Clock Out (SCK3) PPS code: 100000 (0x20) SPI 3 Data Out (SDO3) PPS code: 011111 (0x1F) SPI 3 Slave Select PPS code: 100001

Configure the SPI 1 pins

< Put SCK1 on J10:43

< Put SDO1 on J10:55

The clock pin also needs to be configured as an input

< Set SCK1 on J10:43 as input

Configure the SPI 3 output pins

< Put SCK3 on J10:7

< Put SDO3 on J10:5

< Put SDI3 on J10:44

< Set SCK3 on J10:7 as input

@note

SPI 1 clock configuration

$SCK1 = F_{CY} / (\text{Primary Prescaler} * \text{Secondary Prescaler})$

Assuming that  $F_{CY} = 50\text{MHz}$ , and the prescalers are 4 and 1, the SPI clock frequency will be 12.5MHz.

## 5.10 dspic33e/qcomp-sim-c.X/spi.h File Reference

Description: SPI communication functions.

```
#include "p33EP512MU810.h"
```

```
#include "xc.h"
```

Include dependency graph for spi.h: This graph shows which files directly or indirectly include this file:

### Functions

- int [setup\\_spi](#) (void)  
*Set up serial peripheral interface.*
- int [send\\_byte\\_spi\\_1](#) (int data)  
*Send a byte to the SPI1 peripheral.*
- int [read\\_byte\\_spi\\_3](#) ()  
*Recieve a byte from the SPI3 peripheral.*

### 5.10.1 Detailed Description

Description: SPI communication functions.

### 5.10.2 Function Documentation

#### 5.10.2.1 int send\_byte\_spi\_1 ( int data )

Send a byte to the SPI1 peripheral.

## Parameters

<i>data</i>	byte to be sent to SPI1
-------------	-------------------------

## 5.10.2.2 int setup\_spi ( void )

Set up serial peripheral interface.

## 5.11 dspic33e/qcomp-sim-c.X/tests.c File Reference

Description: Contains all the tests we have performed on the micro- controller.

```
#include "tests.h"
#include "io.h"
#include "quantum.h"
#include "time.h"
```

Include dependency graph for tests.c:

### Functions

- void [dim\\_leds](#) ()

*Testing the speed of  $2^{15}$  2x2 real matrix multiplications void mat\_mul\_test() {.*

### 5.11.1 Detailed Description

Description: Contains all the tests we have performed on the micro- controller.

### 5.11.2 Function Documentation

#### 5.11.2.1 void dim\_leds ( )

Testing the speed of  $2^{15}$  2x2 real matrix multiplications void mat\_mul\_test() {.

Define state vector  $|0\rangle = (1,0)$   $|1\rangle = (0,1)$  Vector V; init\_state(V, ZERO);

Matrix2 X = {{0}}, Z = {{0}}, H = {{0}}; make\_ops(X, Z, H);

Start the timer start\_timer();

Do a matrix multiplication test unsigned int n = 0; while (n < 32768) { mat\_mul(X, V); n++; }

Read the timer unsigned long int time = read\_timer();

Show that the test is finished set\_led(red, on);

wait (add a breakpoint here) while(1 == 1);

}

## 5.12 dspic33e/qcomp-sim-c.X/tests.h File Reference

Description: Header file containing all the tests we performed.

```
#include "p33EP512MU810.h"
```

```
#include "xc.h"
```

Include dependency graph for tests.h: This graph shows which files directly or indirectly include this file:

### Functions
